# Disclaimer

Paladin Blockchain Security ("Paladin") has conducted an independent audit to verify the integrity of and highlight any vulnerabilities or errors, intentional or unintentional, that may be present in the codes that were provided for the scope of this audit. This audit report does not constitute agreement, acceptance or advocacy for the Project that was audited, and users relying on this audit report should not consider this as having any merit for financial advice in any shape, form or nature. The contracts audited do not account for any economic developments that may be pursued by the Project in question, and that the veracity of the findings thus presented in this report relate solely to the proficiency, competence, aptitude and discretion of our independent auditors, who make no guarantees nor assurance that the contracts are completely free of exploits, bugs, vulnerabilities or deprecation of technologies. Further, this audit report shall not be disclosed nor transmitted to any persons or parties on any objective, goal or justification without due written assent, acquiescence or approval by Paladin.

All information provided in this report does not constitute financial or investment advice, nor should it be used to signal that any persons reading this report should invest their funds without sufficient individual due diligence regardless of the findings presented in this report. Information is provided 'as is', and Paladin is under no covenant to the completeness, accuracy or solidity of the contracts audited. In no event will Paladin or its partners, employees, agents or parties related to the provision of this audit report be liable to any parties for, or lack thereof, decisions and/or actions with regards to the information provided in this audit report.

Cryptocurrencies and any technologies by extension directly or indirectly related to cryptocurrencies are highly volatile and speculative by nature. All reasonable due diligence and safeguards may yet be insufficient, and users should exercise considerable caution when participating in any shape or form in this nascent industry.

The audit report has made all reasonable attempts to provide clear and articulate recommendations to the Project team with respect to the rectification, amendment and/or revision of any highlighted issues, vulnerabilities or exploits within the contracts provided. It is the sole responsibility of the Project team to sufficiently test and perform checks, ensuring that the contracts are functioning as intended, specifically that the functions therein contained within said contracts have the desired intended effects, functionalities and outcomes of the Project team.

Paladin retains full rights over all intellectual property (including expertise and new attack or exploit vectors) discovered during the audit process. Paladin is therefore allowed and expected to re-use this knowledge in subsequent audits and to inform existing projects that may have similar vulnerabilities. Paladin may, at its discretion, claim bug bounties from third-parties while doing so.

# 1 Overview

This report has been prepared for Zappy Finance on the Telos EVM network. Paladin provides a user-centred examination of the smart contracts to look for vulnerabilities, logic errors or other issues from both an internal and external perspective.

## 1.1 Summary

|                     |   |
|---------------------|---|
| <b>Project Name</b> | Zappy Finance   |
| <b>URL</b>          | <a href="https://zappy.finance/">https://zappy.finance/</a> |
| <b>Platform</b>     | Telos EVM   |
| <b>Language</b>     | Solidity  |

## 1.2 Contracts Assessed

| Name              | Contract                                   | Live Code Match |
|-------------------|--|-----------------|
| MasterChef        | 0x3D2c6bCED5f50f5412234b87fF0B445aBA4d10e9 | ✓ MATCH         |
| ZappyToken        | 0x9A271E3748F59222f5581BaE2540dAa5806b3F77 | ✓ MATCH         |
| UniswapV2ERC20    | Dependency                                 | ✓ MATCH         |
| UniswapV2Factory  | 0x4be5Bf2233a0fd2c7D1472487310503Ec8E857be | ✓ MATCH         |
| UniswapV2Pair     | Dependency                                 | ✓ MATCH         |
| UniswapV2Router02 | 0xB9239AF0697C8efb42cBA3568424b06753c6da71 | ✓ MATCH         |

## 1.3 Findings Summary

| Severity        | Found     | Resolved  | Partially Resolved | Acknowledged (no change made) |
|-----------------|-----------|-----------|--------------------|-------------------------------|
| ● High          | 1         | 1         | -                  | -                             |
| ● Medium        | 1         | -         | 1                  | -                             |
| ● Low           | 3         | 1         | -                  | 2                             |
| ● Informational | 22        | 8         | -                  | 14                            |
| <b>Total</b>    | <b>27</b> | <b>10</b> | <b>1</b>           | <b>16</b>                     |

### Classification of Issues

| Severity        | Description  |
|-----------------|--|
| ● High          | Exploits, vulnerabilities or errors that will certainly or probabilistically lead towards loss of funds, control, or impairment of the contract and its functions. Issues under this classification are recommended to be fixed with utmost urgency. |
| ● Medium        | Bugs or issues that may be subject to exploit, though their impact is somewhat limited. Issues under this classification are recommended to be fixed as soon as possible.  |
| ● Low           | Effects are minimal in isolation and do not pose a significant danger to the project or its users. Issues under this classification are recommended to be fixed nonetheless.   |
| ● Informational | Consistency, syntax or style best practices. Generally pose a negligible level of risk, if any.  |

## 1.3.1 MasterChef

| ID | Severity | Summary   | Status       |
|----|----------|---|--------------|
| 01 | HIGH     | Deposits do not support fee-on-transfer tokens  | RESOLVED     |
| 02 | MEDIUM   | Deposits and withdrawals can revert when the hard-cap is (almost) reached   | PARTIAL      |
| 03 | LOW      | Setting to the zero address will break deposit and withdraw functionality   | ACKNOWLEDGED |
| 04 | LOW      | pendingZAP and updatePool will revert if totalAllocPoint is zero  | ACKNOWLEDGED |
| 05 | INFO     | Unnecessary dependency: SafeMath  | ACKNOWLEDGED |
| 06 | INFO     | zap can be made immutable   | ACKNOWLEDGED |
| 07 | INFO     | Lack of events for setZapPerSecond, add and dev   | ACKNOWLEDGED |
| 08 | INFO     | Pool uses the contract balance to figure out the total deposits   | ACKNOWLEDGED |
| 09 | INFO     | Validation not added for constructor variables  | ACKNOWLEDGED |
| 10 | INFO     | Missing token validation  | ACKNOWLEDGED |
| 11 | INFO     | Typographical errors  | ACKNOWLEDGED |
| 12 | INFO     | massUpdatePools() can run out of gas  | ACKNOWLEDGED |
| 13 | INFO     | pendingZAP does not account for the maxSupply   | ACKNOWLEDGED |
| 14 | INFO     | Rounding vulnerability to tokens with a very large supply can cause large supply tokens to receive zero emissions | ACKNOWLEDGED |
| 15 | INFO     | deposit, withdraw, emergencyWithdraw and dev can be made external   | ACKNOWLEDGED |
| 16 | INFO     | Gas optimization: Implementation of checkForDuplicate can unnecessarily run out of gas                            | ACKNOWLEDGED |

## 1.3.2 ZappyToken

| ID | Severity | Summary   | Status       |
|----|----------|---|--------------|
| 17 | LOW      | mint function can be used to pre-mint large amounts of tokens before ownership is transferred to the Masterchef | RESOLVED     |
| 18 | INFO     | delegateBySig can be frontrun and cause denial of service   | RESOLVED     |
| 19 | INFO     | mint can be made external   | ACKNOWLEDGED |
| 20 | INFO     | Typographical error   | ACKNOWLEDGED |

## 1.3.3 UniswapV2ERC20

| ID | Severity | Summary   | Status   |
|----|----------|---|----------|
| 21 | INFO     | The Approval event is not emitted if allowance is changed in transferFrom as suggested in the ERC-20 Token Standard (also present in Uniswap) | RESOLVED |
| 22 | INFO     | permit can be front-run to prevent someone from calling removeLiquidityWithPermit (also present in Uniswap)                                   | RESOLVED |

## 1.3.4 UniswapV2Factory

| ID | Severity | Summary                                       | Status   |
|----|----------|---|----------|
| 23 | INFO     | Lack of event emissions for sensitive changes | RESOLVED |

## 1.3.5 UniswapV2Pair

No issues found.

## 1.3.6 UniswapV2Router02

| ID | Severity | Summary   | Status   |
|----|----------|---|----------|
| 24 | INFO     | Phishing is possible by a malicious frontend by adjusting routes, tokens or from parameters (also present in Uniswap)                                     | RESOLVED |
| 25 | INFO     | Constructor inputs lack a zero address input verification   | RESOLVED |
| 26 | INFO     | Function addLiquidity does still not fully support reflective tokens upon transfer  | RESOLVED |
| 27 | INFO     | Pairs without supply but with a partial reserve might crash the frontend if the user wants to swap on this pair (this issue is present in most frontends) | RESOLVED |

# 2 Findings (Zappy Farm)

---

## 2.1 MasterChef

The MasterChef is a staking contract which allows the user to deposit various LP tokens and receive Zappy Tokens as a reward. It mints an additional 10% of the tokens to the dev address. Additionally, this contract does not have any deposit fees.

### 2.1.1 Privileged Functions

The following functions can be called by the owner of the contract:

- setZapPerSecond
- add
- set
- dev
- transferOwnership
- renounceOwnership

## 2.1.2 Issues & Recommendations

|                       |  |
|-----------------------|--|
| <b>Issue #01</b>      | <b>Deposits do not support fee-on-transfer tokens</b>  |
| <b>Severity</b>       |  HIGH SEVERITY  |
| <b>Description</b>    | <p>The deposit function of the MasterChef presently lacks support for fee-on-transfer tokens. This means that during a deposit of such tokens, the Masterchef will actually receive less tokens than it thinks it has received.</p> <p>This not only leads to the fact that not everyone will be able to withdraw such tokens, it also can be exploited where a malicious user can drain the whole pool, resulting in absurd reward minting. This is because the reward distribution mechanism gives an emission multiplier if lpSupply in the updatePool function is smaller than the user .amount value.</p> |
| <b>Recommendation</b> | <p>Consider using a before-after pattern to account for the transfer tax.</p> <pre>uint256 balanceBefore = pool.lpToken.balanceOf(address(this)); pool.lpToken.safeTransferFrom(msg.sender, address(this), _amount); _amount = pool.lpToken.balanceOf(address(this)).sub(balanceBefore);</pre> <p>Do note that such a pattern must always be accompanied with a nonReentrant modifier to avoid exploitation.</p>   |
| <b>Resolution</b>     |  RESOLVED   |
|                       | <p>The client has indicated that their Masterchef is solely supposed to work with LP tokens which do not have a transfer tax. The client should however remain extremely vigilant whenever adding a new token.</p>   |

**Issue #02****Deposits and withdrawals can revert when the hard-cap is (almost) reached****Severity** MEDIUM SEVERITY**Description**

Currently, the `updatePool` function will fail when the `maxSupply` is reached as the `mint` function in the token will revert.

**Recommendation**

Consider implementing the following code to account for the decreased `zapReward`:

```
uint256 zapReward =
multiplier.mul(zapPerSecond).mul(pool.allocPoint).div(totalAllocPoint);
uint256 remaining = zap.getMaxTotalSupply().sub(zap.totalSupply());
uint256 devReward = zapReward.div(10));

if (remaining < zapReward.add(devReward)) {
    zapReward = remaining;
    devReward = 0;
}
if(zapReward > 0) {
    zap.mint(address(this), zapReward);
}
if (devReward > 0) {
    zap.mint(devaddr, devReward);
}
```

The client should carefully test this behavior by fully going to this scenario in their test deployment.

**Resolution** PARTIALLY RESOLVED

The client has indicated that they will immediately disable emissions when the `maxSupply` is reached. This will minimize the impact of this issue. In case the client fails to do so, users can still withdraw using the `emergencyWithdraw` function on the contract.

**Issue #03****Setting devaddr to the zero address will break deposit and withdraw functionality****Severity** LOW SEVERITY**Description**

Within most token contracts, minting or transferring tokens to the zero address will revert the transaction. This could cause deposits to revert when the deposit fee is transferred to a zero devaddr.

**Recommendation**

To prevent this from ever happening by accident and to limit governance risks, consider adding a requirement like the following:

```
require(_devaddr != address(0), "!nonzero");
```

to the relevant configuration function.

**Resolution** ACKNOWLEDGED

The client has indicated that they will keep this in mind and avoid setting the devaddr to zero.

**Issue #04****pendingZAP and updatePool will revert if totalAllocPoint is zero****Severity** LOW SEVERITY**Description**

In the pendingZAP and updatePool functions, at some point a division is made by the totalAllocPoint variable. If all pools have their rewards set to zero, this variable will be zero as well. The requests will then revert with a division by zero error.

**Recommendation**

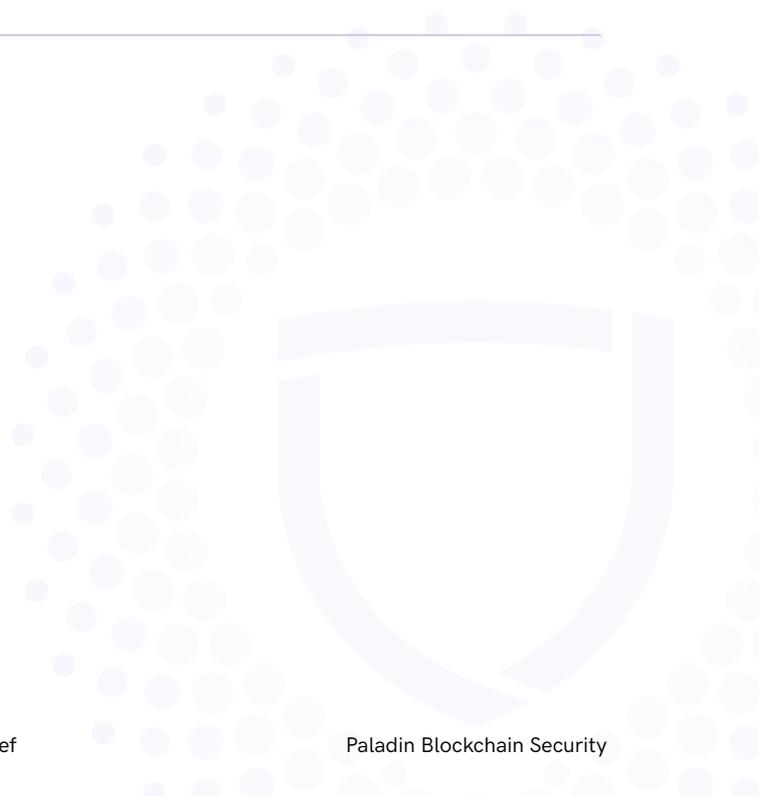

Consider only calculating the accumulated rewards since the lastRewardTime if the totalAllocPoint variable is greater than zero. This check can simply be added to the existing check that verifies the block.timestamp and lpSupply, like so:

```
if (block.timestamp > pool.lastRewardTime && lpSupply != 0  
&& totalAllocPoint > 0) {
```

**Resolution** ACKNOWLEDGED

|                       |  |
|-----------------------|--|
| <b>Issue #05</b>      | <b>Unnecessary dependency: SafeMath</b>  |
| <b>Severity</b>       | <span>INFORMATIONAL</span>   |
| <b>Location</b>       | <u>Line 1536</u><br>Using SafeMath for uint256;  |
| <b>Description</b>    | Usage of SafeMath is considered best practice to secure the code against overflows or underflows. However, this is not necessary when Solidity version $\geq 0.8.0$ is used. |
| <b>Recommendation</b> | Consider removing the SafeMath dependency and adjust the code accordingly or simply acknowledge this issue.  |
| <b>Resolution</b>     | <span>ACKNOWLEDGED</span>  |

|                       |  |
|-----------------------|--|
| <b>Issue #06</b>      | <b>zap can be made immutable</b>   |
| <b>Severity</b>       | <span>INFORMATIONAL</span>   |
| <b>Description</b>    | Variables that are only set in the constructor but never modified can be indicated as such with the immutable keyword. This is considered best practice since it makes the code more accessible for third-party reviewers and saves gas. |
| <b>Recommendation</b> | Consider making the variable explicitly immutable.   |
| <b>Resolution</b>     | <span>ACKNOWLEDGED</span>  |

|                       |   |
|-----------------------|---|
| <b>Issue #07</b>      | <b>Lack of events for setZapPerSecond, add and dev</b>  |
| <b>Severity</b>       | <span style="color: purple;">●</span> INFORMATIONAL   |
| <b>Description</b>    | Functions that affect the status of sensitive variables should emit events as notifications.  |
| <b>Recommendation</b> | Add events for the above functions.   |
| <b>Resolution</b>     | <span style="background-color: #ccc; border-radius: 50%; padding: 2px;">● ACKNOWLEDGED</span> |

|                       |   |
|-----------------------|---|
| <b>Issue #08</b>      | <b>Pool uses the contract balance to figure out the total deposits</b>  |
| <b>Severity</b>       | <span style="color: purple;">●</span> INFORMATIONAL   |
| <b>Description</b>    | As with pretty much all Masterchefs and staking contracts, the total number of tokens in the contract is used to determine the total number of deposits. This can cause dilution of rewards when people accidentally send tokens to the Masterchef. |
| <b>Recommendation</b> | Consider adding an lpSupply variable to the PoolInfo that keeps track of the total deposits.  |
| <b>Resolution</b>     | <span style="background-color: #ccc; border-radius: 50%; padding: 2px;">● ACKNOWLEDGED</span>   |

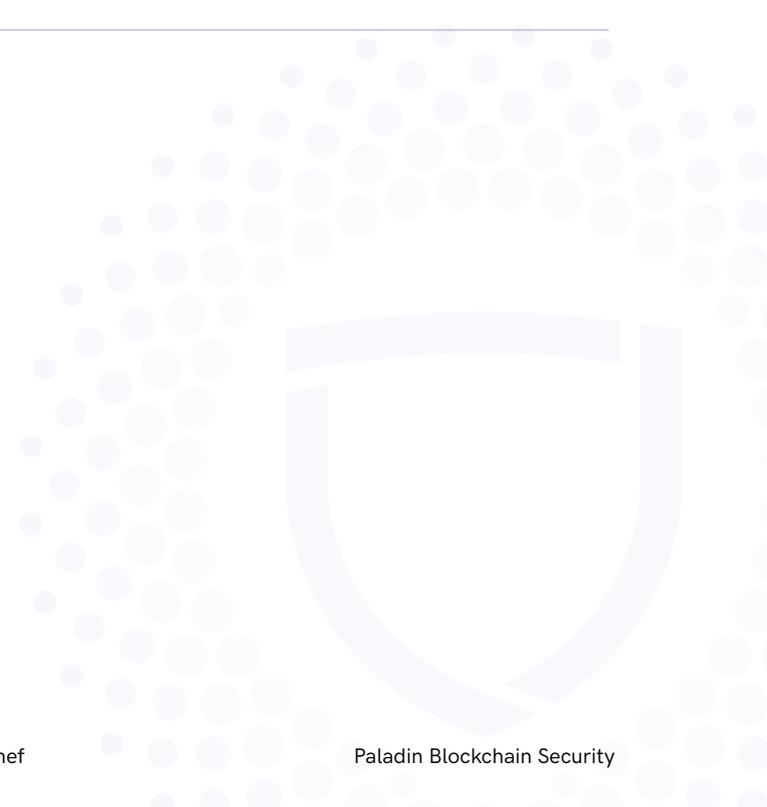

|                       |  |
|-----------------------|--|
| <b>Issue #09</b>      | <b>Validation not added for constructor variables</b>  |
| <b>Severity</b>       | <span style="color: purple;">●</span> INFORMATIONAL  |
| <b>Description</b>    | Within the constructor, there are important variables defined which are not validated at all. If, for example, the devaddr is set to the zero address, this will break deposits and withdrawals. |
| <b>Recommendation</b> | Consider adding all necessary validations within the constructor.  |
| <b>Resolution</b>     | <span style="background-color: #ccc; border-radius: 50%; padding: 2px;">● ACKNOWLEDGED</span>  |

|                       |  |
|-----------------------|--|
| <b>Issue #10</b>      | <b>Missing token validation</b>  |
| <b>Severity</b>       | <span style="color: purple;">●</span> INFORMATIONAL  |
| <b>Description</b>    | Within the add function, governance can add specific pools for different lpToken; however, the validation for this lpToken is missing, which can lead to a broken pool if a lpToken is added that does not exist at all. |
| <b>Recommendation</b> | Consider adding <code>_lpToken.balanceOf(address(this))</code> for token validation.   |
| <b>Resolution</b>     | <span style="background-color: #ccc; border-radius: 10px; padding: 2px;">● ACKNOWLEDGED</span>   |

|                       |  |
|-----------------------|--|
| <b>Issue #11</b>      | <b>Typographical errors</b>  |
| <b>Severity</b>       | <span style="color: purple;">●</span> INFORMATIONAL  |
| <b>Description</b>    | <p>The contract contains a number of typographical errors which are enumerated below in a single issue in an effort to keep the report size reasonable.</p> <p><u>Line 1673</u></p> <pre>require(_allocPoint &lt;= MaxAllocPoint, "add: too many alloc points!!");</pre> <p>The contract still mentions add.</p> <p><u>Line 1785 (example)</u></p> <pre>pool.lpToken.safeTransfer(address(msg.sender), oldUserAmount);</pre> <p>Casting <code>msg.sender</code> to <code>address</code> is unnecessary. This error can be found in various sections.</p> |
| <b>Recommendation</b> | Consider fixing the above typographical errors.  |
| <b>Resolution</b>     | <span style="background-color: #ccc; border-radius: 10px; padding: 2px;">● ACKNOWLEDGED</span>   |

|                       |   |
|-----------------------|---|
| <b>Issue #12</b>      | <b>massUpdatePools() can run out of gas</b>   |
| <b>Severity</b>       | <span>INFORMATIONAL</span>  |
| <b>Description</b>    | Within the massUpdatePools() function, updatePools() is called for each existing pool. However, if there are too many pools, this function may eventually run out of gas. |
| <b>Recommendation</b> | Consider adding a boolean variable withUpdate for the set, add and setZapPerSecond function which will call massUpdatePools() or not.                                     |
| <b>Resolution</b>     | <span>ACKNOWLEDGED</span>   |

|                       |   |
|-----------------------|---|
| <b>Issue #13</b>      | <b>pendingZAP does not account for the maxSupply</b>  |
| <b>Severity</b>       | <span>INFORMATIONAL</span>  |
| <b>Description</b>    | During the pendingZAP function, there is currently no accounting for the case if the maxSupply is reached. This can lead to misleading information on the frontend. |
| <b>Recommendation</b> | Consider adding a logic that accounts for the maxSupply. Inspiration can be taken from a previous recommendation with regards to updatePool.                        |
| <b>Resolution</b>     | <span>ACKNOWLEDGED</span>   |

**Issue #14****Rounding vulnerability to tokens with a very large supply can cause large supply tokens to receive zero emissions****Severity** INFORMATIONAL**Description**

Within `updatePool`, `deposit`, `withdraw` and the `pendingZap` function, `accZAPPerShare` is based upon the `lpSupply` variable.

```
pool.accZAPPerShare =  
pool.accZAPPerShare.add(zapReward.mul(1e12).div(lpSupply));
```

However, if this `lpSupply` becomes a severely large value this will cause precision errors due to rounding. This is famously seen when pools decide to add meme-tokens which usually have huge supplies and no decimals.

**Recommendation**

Consider increasing precision to `1e18` across the entire contract. It should be noted that even a precision of `1e18` can be imprecise in some edge cases.

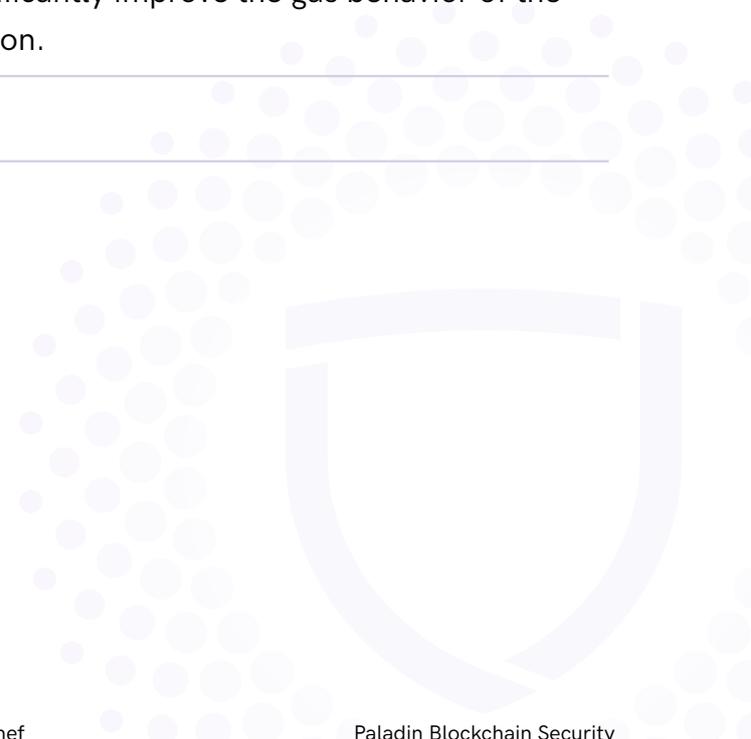

In case the client thinks it is probable that such tokens will be added, we recommend testing which precision variable is most appropriate to support them without potentially reverting due to overflows.

**Resolution** ACKNOWLEDGED

The client has indicated that they have no plans to add such tokens.

|                       |   |
|-----------------------|---|
| <b>Issue #15</b>      | <b>deposit, withdraw, emergencyWithdraw and dev can be made external</b>  |
| <b>Severity</b>       | <span style="color: purple;">●</span> INFORMATIONAL   |
| <b>Description</b>    | Functions that are not used within the contract but only externally can be marked as such with the external keyword. Apart from being a best practice when the function is not used within the contract, this can lead to a lower gas usage in certain cases. |
| <b>Recommendation</b> | Consider marking the above functions as external.   |
| <b>Resolution</b>     | <span style="background-color: #ccc; border-radius: 10px; padding: 2px;">● ACKNOWLEDGED</span>  |

|                       |  |
|-----------------------|--|
| <b>Issue #16</b>      | <b>Gas optimization: Implementation of checkForDuplicate can unnecessarily run out of gas</b>  |
| <b>Severity</b>       | <span style="color: purple;">●</span> INFORMATIONAL  |
| <b>Description</b>    | <p>The checkForDuplicate function iterates over all pools to check if the token already exists. If a newly added token already exists in a previous pool, this check causes the add function to revert.</p> <p>Although we understand the value of this function, the implementation can be significantly improved by using a mapping.</p> |
| <b>Recommendation</b> | Consider using <code>mapping(address =&gt;bool) public tokenPoolExists;</code> to significantly improve the gas behavior of the checkForDuplicate function.  |
| <b>Resolution</b>     | <span style="background-color: #ccc; border-radius: 10px; padding: 2px;">● ACKNOWLEDGED</span>   |

---

## 2.2 ZappyToken

The Zappy Token is the governance token of the Zappy Farm. It is distributed amongst users staking in the MasterChef and has a maximum supply of 27,000,000 tokens. The token allows for Zappy tokens to be minted when the `mint` function is called by the owner of the contract, which at the time of deployment would be the Zappy team. Users should therefore carefully inspect that ownership of this contract has been transferred to the MasterChef.

Finally, it contains similar voting logic as in tokens like Compound and Yam, however, the client has indicated that they have no immediate plans to use it.

### 2.2.1 Privileged Functions

The following functions can be called by the owner of the contract:

- `mint`
- `transferOwnership`
- `renounceOwnership`

## 2.2.2 Token Overview

|                          |  |
|--------------------------|--|
| <b>Address</b>           | 0x9A271E3748F59222f5581BaE2540dAa5806b3F77 |
| <b>Token Supply</b>      | 27,000,000                                 |
| <b>Decimal Places</b>    | 18   |
| <b>Transfer Max Size</b> | No maximum                                 |
| <b>Transfer Min Size</b> | No minimum                                 |
| <b>Transfer Fees</b>     | None                                       |
| <b>Pre-mints</b>         | None                                       |

## 2.2.3 Issues & Recommendations

|                       |  |
|-----------------------|--|
| <b>Issue #17</b>      | <b>mint function can be used to pre-mint large amounts of tokens before ownership is transferred to the Masterchef</b>   |
| <b>Severity</b>       |  LOW SEVERITY   |
| <b>Description</b>    | <p>The mint function allows the owner (contract deployer) to mint tokens before ownership is transferred to the Masterchef. This could be used to mint a large amount of tokens and potentially dump them on user generated liquidity when the token contract has been deployed but before ownership is set to the Masterchef contract.</p> <p>This risk is prevalent amongst less-reputable projects, and any pre-mints can be prominently seen on the blockchain's explorer.</p> |
| <b>Recommendation</b> | Consider being forthright if this mint function is to be used by letting your community know how much was minted, where the tokens are currently stored, if a vesting contract was used for token unlocking, and finally the purpose of the mints.   |
| <b>Resolution</b>     |  RESOLVED   |
|                       | <p>The token has been fully deployed and the ownership has already been transferred to the MasterChef.</p> <p>The client has also indicated that users who want to understand how the minting privileges were used before ownership was transferred can find this out either through on-chain transactions or by reading their documentation at <a href="https://docs.zappy.finance/token-supply-breakdown">https://docs.zappy.finance/token-supply-breakdown</a>.</p>             |

**Issue #18****delegateBySig can be frontrun and cause denial of service****Severity** INFORMATIONAL**Description**

Currently if `delegateBySig` is executed twice, the second execution will be reverted. It is thus in theory possible for a bot to pick up `delegateBySig` transactions in the mempool and execute them before a contract can. The issue with this is that the rest of said contract functionality would be lost as well. This could be a problem in case it would have been executed by a contract that would have rewarded you for your delegation for example.

This same issue also presents itself within the `permit` function from `ERC20Permit`.

**Recommendation**

Consider this issue if there are ever complaints by users that their transactions are failing. It could be the case that someone is using this vector against them.

Additionally, derivative contracts that are using `delegateBySig` and `permit` should be adjusted for the fact that these function executions might have been front-ran.

**Resolution** RESOLVED

The client has indicated that they understand this behavior and will account for it if they ever develop contracts that use `delegateBySig` and `permit`.

**Issue #19****mint can be made external****Severity** INFORMATIONAL**Description**

Functions that are not used within the contract but only externally can be marked as such with the `external` keyword. Apart from being a best practice when the function is not used within the contract, this can lead to a lower gas usage in certain cases.

**Recommendation**

Consider marking the function as `external`.

**Resolution** ACKNOWLEDGED

|                       |   |
|-----------------------|---|
| <b>Issue #20</b>      | <b>Typographical error</b>  |
| <b>Severity</b>       | <span>INFORMATIONAL</span>  |
| <b>Location</b>       | <u>Line 835</u><br><code>require(totalSupply() + _amount &lt;= _maxTotalSupply, "ERC20:<br/>minting more <b>then</b> MaxTotalSupply");</code> |
| <b>Description</b>    | The contract contains the above typographical error. This error message should use <i>than</i> instead of <i>then</i> .                       |
| <b>Recommendation</b> | Consider fixing the typographical error.  |
| <b>Resolution</b>     | <span>ACKNOWLEDGED</span>   |

# 3 Findings (Zappy Core)

The Zappy Core section of this audit refers to the AMM deployment contracts, which are a straightforward fork of the trusted and respected Uniswap V2 codebase.

Minimal changes have been made: specifically the swap fee has been reduced to 0.2%. According to [their documentation](#), 75% of this fee (0.15% of the total swap amount) is returned to liquidity stakers, while 25% of this fee (0.05% of the total swap amount) will be used to buy back ZAP and then distributed to ZAP stakers.

All issues mentioned below were not introduced by Zappy.

---

## 3.1 UniswapV2ERC20

The UniswapV2Erc20 contract is an implementation of the ERC-20 Token Standard for denominating pool tokens. It is a fork of Uniswap's UniswapV2Erc20 contract.

## 3.1.1 Issues & Recommendations

|                       |  |
|-----------------------|--|
| <b>Issue #21</b>      | <b>The Approval event is not emitted if allowance is changed in transferFrom as suggested in the ERC-20 Token Standard (also present in Uniswap)</b>   |
| <b>Severity</b>       |  INFORMATIONAL  |
| <b>Description</b>    | <p>The ERC-20 standard specifies that an Approval event should be emitted when the allowance of a user changes. However, within the ERC20 implementation of both Uniswap and Zappy Finance, this is not done.</p> <p>You can read more about this improvement in Pull Request #65 of uniswap-core.</p> |
| <b>Recommendation</b> | Consider adding <code>emit Approval(from, msg.sender, remaining)</code> in <code>transferFrom</code> when allowance is modified.   |
| <b>Resolution</b>     |  RESOLVED   |
|                       | <p>The client has stated that they would like to remain compliant with Uniswap v2.</p>   |

**Issue #22****permit can be front-run to prevent someone from calling  
removeLiquidityWithPermit (also present in Uniswap)****Severity** INFORMATIONAL**Description**

Currently if permit is executed twice, the second execution will be reverted. It is thus in theory possible for a bot to pick up permit transactions in the mempool and execute them before a contract can.

The implications of this issue is that a bad actor could prevent a user from removing liquidity with a permit through the router. It is a denial-of-service attack which is present in all AMMs but which we have yet to witness being used since there is no profit from it.

**Recommendation**

Consider this issue if there are ever complaints by users that their removeLiquidityWithPermit transactions are failing. It could be the case that someone is using this vector against them.

We do not recommend changing this behavior since it would cause a lot of extra work modifying the frontend to account for new permit behavior. This issue is also present in Uniswap after all.

**Resolution** RESOLVED

The client has stated that they would like to remain compliant with Uniswap v2.

---

## 3.2 UniswapV2Factory

The UniswapV2Factory is in charge of managing all the existing asset pairs and allows users to create new pairs if matched tokens for supplying liquidity have no existing contract pair. The UniswapV2Factory deploys UniswapV2Pair contracts.

### 3.2.1 Privileged Functions

The following functions can be called by the owner of the contract:

- `setFeeTo`
- `setFeeToSetter`

## 3.2.2 Issues & Recommendations

|                       |   |
|-----------------------|---|
| <b>Issue #23</b>      | <b>Lack of event emissions for sensitive changes</b>  |
| <b>Severity</b>       |  INFORMATIONAL   |
| <b>Description</b>    | <p>There is a lack of event emission for the following functions that result in sensitive changes and the behavior of the contract:</p> <ul style="list-style-type: none"><li>- setFeeTo</li><li>- setFeeToSetter</li></ul> |
| <b>Recommendation</b> | Emit events with the changed values.  |
| <b>Resolution</b>     |  RESOLVED<br><p>The client has stated that they would like to remain compliant with Uniswap v2.</p>  |

---

## 3.3 UniswapV2Pair

The UniswapV2Pair is involved in storing the asset pairs in a contract for use by the router to add/remove liquidity in equally valued proportions and swap assets. It is a fork from the Uniswap version of this contract. The swapFee is set to 0.2% instead of 0.3%. 1/4 of all swapping fees goes to governance.

### 3.3.1 Issues & Recommendations

No issues found.

---

## 3.4 UniswapV2Router02

The UniswapV2Router02 is the interface for all DEX interactions such as adding liquidity, swapping and removing liquidity. It is a fork of the Uniswap version of this contract.

## 3.4.1 Issues & Recommendations

|                       |   |
|-----------------------|---|
| <b>Issue #24</b>      | <b>Phishing is possible by a malicious frontend by adjusting routes, tokens or from parameters (also present in Uniswap)</b>  |
| <b>Severity</b>       |  INFORMATIONAL   |
| <b>Description</b>    | <p>A malicious (e.g. compromised) frontend can easily mislead users in approving malicious transactions, even if the router matches the address described in this report.</p> <p>An obvious example of how this can be done is by changing the to parameter which indicates to whom tokens or liquidity has to be sent. Other ways to phish could include using malicious routes or tokens.</p> |
| <b>Recommendation</b> | <p>Consider carefully protecting the frontend and ideally having an unchangeable IPFS fallback implementation for it.</p> <p>Users should also verify that they are on the correct website when doing a swap.</p>   |
| <b>Resolution</b>     |  RESOLVED  |
|                       | <p>The client has stated that they would like to remain compliant with Uniswap v2.</p>  |

**Issue #25****Constructor inputs lack a zero address input verification****Severity** INFORMATIONAL**Description**

Inadvertently inputting zero address in the constructor will render the contract unusable and will require redeployment.

**Recommendation**

Consider implementing:

```
require( _factory != address(0), "Cannot be zero address" );
```

and a

```
require( _WETH != address(0), "Cannot be zero address" );
```

statement.

**Resolution** RESOLVED

The client has stated that they would like to remain compliant with Uniswap v2.

**Issue #26****Function addLiquidity does still not fully support reflective tokens upon transfer****Severity** INFORMATIONAL**Description**

The current addLiquidity function always assumes tokens are not reflective, thus resulting in waste should users be opting to transact with reflective tokens.

This issue is also present in Uniswap itself.

**Recommendation**

The client may opt to include the following function that could help calculate the quotes beforehand for fee-on-transfer tokens.

addLiquiditySupportingFeeOnTransfer first sends the feeToken to the pair, then it scales down the amount of tokenB to send to the pair based on how much arrived.

You can read more about this issue here:

<https://github.com/Uniswap/v2-periphery/issues/106>

**Resolution** RESOLVED

The client has stated that they would like to remain compliant with Uniswap v2.

**Issue #27**

**Pairs without supply but with a partial reserve might crash the frontend if the user wants to swap on this pair (this issue is present in most frontends)**

**Severity**

 INFORMATIONAL

**Description**

A malicious DoS attack we have witnessed in practice is when a project wants to go live through a presale, people can instantiate the pair while there are no tokens yet. The malicious party will then sent some of the counterparty token to this pair so it has a partial balance (eg. 0.1 TELOS and 0 tokens). When `sync()` is then called, the pairs' reserves are updated to account for this balance.

Due to a division by zero exception, many frontends cannot properly account for this state and will go through a blank page, preventing the original project from adding liquidity through the frontend.

**Recommendation**

Consider checking whether this is present in the frontend and adding a division by zero handler.

**Resolution**

 RESOLVED

The client has stated that they would like to remain compliant with Uniswap v2.
